# 1.0 General Description of the Building 829 (B-829) Facility at Site 300

## 1.1 Description of Site 300

The Lawrence Livermore National Laboratory (LLNL) Site 300 (Site 300) is owned by the U.S. Department of Energy (DOE) and, effective October 1, 2007, has been operated by Lawrence Livermore National Security, LLC (LLNS), as an experimental test site. This site is located in the southern Altamont Hills of the Diablo Range, which is part of the Coast Range Physiographic Province. It is situated about 20 km (12 mi) east of the LLNL main site (**Figure 1**). Site 300 covers an area of approximately 28.3 $km^2$ (10.9 $mi^2$) north of Corral Hollow Road (**Figure 2**). Its elevation ranges from about 150 m (490 ft) in the southeast corner to about 530 m (1740 ft) in the northwest area. The western one-sixth of the site lies in Alameda County; the remaining portion is in San Joaquin County. The surrounding land is primarily agricultural. Site 300 is an active Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) site.

## 1.2 Description of the B-829 Facility

As shown in **Figure 2**, the B-829 Facility is located in the High-Explosives (HE) Process Area Operable Unit in the south-central portion of Site 300. The B-829 Facility, part of the B-829 Complex, was used to thermally treat explosives process waste generated by operations at Site 300 and similar waste from explosives research operations at the LLNL Livermore site. The B-829 Facility was operated under the Resource Conservation and Recovery Act (RCRA) as an interim status treatment facility. Built in 1955, the B-829 Facility consisted of three separate burn pits, which were constructed in unconsolidated sediments, and an open-air burn unit. The B-829 Facility was closed in 1998, and an impervious cap was constructed over the burn pits as described in the *Final Closure Plan for the High-Explosives Open Burn Treatment Facility at Lawrence Livermore National Laboratory Experimental Test Site 300* (B-829 Final Closure Plan) (Mathews and Taffet, 1997).

# 2.0 Post-Closure Monitoring and Inspection Activities

Monitoring and inspection of the closed burn pits during the post-closure period reflect the prime consideration: to protect human health and the environment by preventing any infiltration of rainwater that may cause the low concentrations of metals, radioactivity (i.e., gross alpha and gross beta), explosive compounds and volatile organic compounds (VOCs) in near-surface soils to migrate to groundwater. The design of the post-closure plan was originally presented in Chapter 2 of the *B-829 Final Closure Plan* (Mathews and Taffet, 1997).

In January 2002, LLNL submitted a revised *Post-Closure Permit Application for the B829 Facility* (LLNL, 2001) to the Department of Toxic Substances Control (DTSC). Subsequently, in February 2003, the DTSC issued the *Hazardous Waste Facility Post-Closure Permit for the B829 Facility* (DTSC, 2003), effective April 3, 2003 through April 2, 2013.

LLNL requested a permit modification in April 2005 (LLNL 2005) to amend the text of the Building 829 Post Closure Operation Plan (formerly known as the "Post Closure Permit Application"). The revised operations plan reflects reductions in monitoring frequency for

wells W-829-15 and W-829-22 as provided in Part III, 4(a) of the permit (DTSC 2003), and includes statistical limits for constituents of concern consistent with the data contained in the LLNL Site 300 *Compliance Monitoring Program for the Closed Building 829 Facility* Annual Report 2004 (Revelli, 2005). On July 20, 2005, DTSC granted LLNL permission to implement these changes immediately (DTSC, 2005).

## 2.1 Groundwater Monitoring

Based on groundwater samples recovered from boreholes, previous CERCLA remedial investigations determined that the perched groundwater near the B-829 Facility was contaminated with VOCs, primarily trichloroethene (TCE), but that the deeper regional aquifer was free of any contamination stemming from operation of the facility (Webster-Scholten, 1994). Subsequent assays of soil samples obtained from shallow boreholes prior to closure revealed that low concentrations of HE compounds, VOCs, and metals exist beneath the burn pits (Mathews and Taffet, 1997). Conservative transport modeling indicates that the shallow contamination will not adversely impact the regional aquifer, primarily because its downward movement is blocked by more than 100 m (330 ft) of unsaturated Neroly Formation sediments that include interbeds of claystone and siltstone. At this location in the regional aquifer, the flow rate is low; an estimated 0.05 to 0.1 gallons/minute. The groundwater flow velocity is about 20 feet/year, and the direction of flow is approximately ESE.

Beginning in 1999, the dual-purpose, groundwater-monitoring program described in the *B-829 Final Closure Plan* (Mathews and Taffet, 1997) was initiated for this area to track the fate of contaminants in the soil and perched water-bearing zone, and to monitor the deep regional aquifer for the unlikely appearance of any potential contaminants from the closed burn facility. This monitoring program remained in effect through the first quarter of 2003, at which time LLNL began implementation of the provisions specified in the *Hazardous Waste Facility Post-Closure Permit for the B829 Facility* (DTSC, 2003). Following the guidance outlined in the DTSC *Technical Completeness* (DTSC, 2002) assessment, LLNL installed one additional groundwater monitoring well (W-829-1938) at the point of compliance (POC) within 10 ft of the edge of the capped High Explosive Open Burn Treatment Facility. This well was screened in the regional aquifer, beneath the B-829 Facility. Since the first quarter of 2004, and continuing through 2007, well W-829-1938 has been used for quarterly collection of groundwater samples from the regional aquifer, as part of the permit-specified monitoring network (**Figure 3**). Also shown in **Figure 3** are two previously existing wells (W-829-15 and W-829-22), which were each sampled once in 2007, in accordance with the DTSC-approved change in sampling frequency (from quarterly to annually) for these two wells (DTSC, 2005). The data obtained during CY 2007 are discussed in **Section 3.1.**

LLNL uses statistical methods consistent with the state regulations [California Code of Regulations (CCR) Title 22, Section 66264.97(e)(8)(D)] to accomplish the monitoring and reporting provisions of the post-closure plan (Mathews and Taffet, 1997). The methodology relies on our ability to establish a background concentration, which is defined as the concentration limit (CL), for each constituent of concern (COC). Additionally, statistically determined limits of concentration (SLs) for the COCs have been calculated from the monitoring data.

The CL and SL values presented in **Table 1** replicate those limits documented in the 2006 Annual Report (Revelli, 2007). For wells W-829-15 and W-829-22, established before the permit (DTSC, 2003) was issued, the limits were first included in the 2002 Annual Report (Revelli, 2003). For well W-829-1938, developed in accordance with DTSC requirements (DTSC, 2002), the CLs and SLs were first included in the 2005 Annual Report (Revelli, 2006). These SL values (**Table 1**) served as the limits against which the analytical results from 2007 were compared. The SLs for most COCs in **Table 1** are given as the analytical reporting limits (RLs), because the measurements are below the detection limits for those constituents.

SLs provide the basis for comparison with COC measurements in subsequent years to identify potential releases to the deep regional aquifer. If a future measurement exceeds an SL, LLNL will implement a method of data verification that involves two discrete retests, in accordance with CCR Section 66264.97(e)(8)(E). If an exceedance is confirmed by either or both of the retests, these results will be interpreted and reported as "statistically significant evidence of a release of the COC to groundwater."

### 2.2 Inspection and Maintenance

The permit (DTSC, 2003) requires that LLNL perform quarterly inspections of the monitoring wells and monthly visual inspections of the closed B-829 Facility (final cover cap, drainage and diversion ditches, groundwater monitoring system, signage, etc.). Additional inspections are required after major rainstorms, significant earthquakes, or other events that may cause substantial damage to the capped facility. Any deficiencies noted, such as erosion of the cover, fissures or low spots, burrowing by animals, and bare areas needing reseeding, are remediated. In addition to these inspections performed by LLNL staff, an independent, California-registered Professional Engineer (PE) must perform an annual engineering inspection. The PE prepares a written inspection report, which includes comments and recommendations, and submits that documentation to LLNL.

## 3.0 Results of Post-Closure Monitoring and Inspection for CY 2007

### 3.1 Discussion of Monitoring Results

CY 2007 analytical results for the well locations W-829-15, W-829-22, and W-829-1938 are listed in **Tables 2, 3, and 4**, respectively. The annual sampling required for wells W-829-15 and W-829-22 (DTSC, 2005) was conducted during the second quarter of 2007, while well W-829-1938 was sampled quarterly. Note that all non-detections of constituents are shown in the data tables as being less than (<) the analytical reporting limit.

**Appendix A** presents graphical depictions of the pre-sampling groundwater elevations (GWE) and concentration trends for all confirmed COC detections above their respective RLs, for the permit-specified wells (W-829-15, W-829-22, and W-829-1938). Graphs for the two established wells (W-829-15 and W-829-22) present data accumulated over the last nine years, going back to 1999, the first year of monitoring under the *B-829 Final Closure Plan* (Mathews and Taffet, 1997). The graphs for well W-829-1938, which was installed during CY 2003, present sixteen quarters of data; beginning with the first-quarter results from CY 2004.

In addition to the pre-sampling GWE measurements plotted in **Appendix A**, LLNL collects quarterly GWE measurements for the wells in this network as part of a larger, site-wide study. **Tables 2 and 3** include the results of this GWE study for the two wells in the B-829 network (W-829-15 and W-829-22) that were only sampled once during the year. The GWEs, for any given well, show essentially no fluctuation (less than one foot) across the four quarterly measurements.

The concentration trends shown in **Appendix A** generally reflect the natural background variability of the analytes detected at each of the three monitoring well locations. Only two plots, chromium at well W-829-15 and gross beta at well W-829-15, suggest that the more recent data (CY 2003 and beyond) might indicate less variable and slightly lower background values (as compared to the CLs presented in **Table 1**) for these constituents. Of the three wells in this network (W-829-15, W-829-22, and W-829-1938), W-829-15 was the first completed (March 1995) and has the longest operation history. LLNL will continue to monitor for similar trends in background concentrations at the more recently completed wells as additional data become available.

During CY 2007 there were no confirmed COC detections, above their respective SLs, in groundwater samples from any of the three monitoring wells. Among the inorganic constituents, perchlorate was not detected above its RL in any sample. The metal COCs that were detected in CY 2007 samples show concentrations below their respective statistical limits (the SLs shown in **Table 1**), and not significantly different from background concentrations (the CLs shown in **Table 1**) for the deep aquifer beneath the HE Process Area. As shown in **Table 4**, the second quarter metals sample from well W-829-1938 was not analyzed for mercury. As a result of a log-in error (at the contract analytical laboratory), the mercury analysis was not performed and the chromium analysis was run with a reporting limit of 3 $\mu$g/L (rather than the typical 1 $\mu$g/L). However, all previous samples, and the two subsequent samples, from this well have shown mercury to be below the 0.2 $\mu$g/L reporting limit. Although the reporting limit of 3 $\mu$g/L for the chromium analysis is still less than the corresponding SL (3.9 $\mu$g/L) for this COC, it should be noted that chromium results from the other three quarters were less than the typical 1 $\mu$g/L reporting limit. All results for gross alpha and gross beta (the radioactive COCs) were below their RL and SL values, respectively. Neither organic nor explosive COCs were detected in any samples at concentrations above their respective RLs.

## 3.2 Inspection of the B-829 Facility

During CY 2007, LLNL staff completed thirteen post-closure inspections of the covered area at the B-829 Facility and four quarterly inspections of the monitoring well network. In June, two inspections of the covered (cap) area were completed, one was conducted at the same time as the cap inspection conducted by the independent California-registered Professional Engineer's inspection (see below) as well as a stand alone inspection conducted at the end of the month. In November, LLNL staff inadvertently missed the monthly cap inspection; however, a make-up inspection was conducted on December 3, 2007. The routine December inspection was conducted on December 15, 2007. To address the issues that resulted in the missed inspection, the inspection schedule requirements have been reviewed with the individual conducting inspections and his supervisor. Cap inspections will now routinely be made within the first half of the month and inspection checklists will be reviewed by the middle of the month to verify

inspections have occurred. Furthermore, LLNL has implemented additional training to help insure completion of the monthly inspections in a timely manner. The inspection checklist form, used during these LLNL inspections, is provided in **Figure 4.** The checklist form used to document the monitoring well inspections, which are required quarterly, is shown in **Figure 5.** All completed forms are retained for three years in the Site 300 Manager's Office files.

The required annual cap inspection by a California-registered Professional Engineer was completed on June 7, 2007. [A copy of the *Building 829 Landfill Cap Annual Engineering Inspection* (Moore, 2007) is included in this report as **Appendix B.**] The inspection included a review of existing documentation on the cap as well as an on-site inspection. With one exception (i.e., some evidence of burrowing), all items required to be inspected under Title 22 of the CCR, Part 66264.228(k), were noted to be in good condition. The annual engineering inspection report contains one recommendation, fill in the animal holes exceeding 18 in. in depth and 6 in. in diameter on the cap and reseed where necessary, which was addressed by the Site 300 Manager's Office during the third quarter of CY 2007.

[a] Column A denotes permit-specified constituents of concern (COCs) for the deep regional aquifer (DTSC 2003).

[b] Column B denotes California state-specified background water quality parameters [22 CCR 66265.97(e) (16)].

[c] No sampling required other than measurement of groundwater elevation (GWE).

[d] Radioactivity results in Becquerels/liter (Bq/L) are shown as the reported sample radioactivity and associated 2σ counting errors.
(Divide these values by 0.037 to convert them to picocuries/liter.)
The reported value is negative when the measured sample radioactivity is less than the measured background activity.
The result is zero when the measured sample radioactivity is equal to the measured background activity.

## Post-Closure Inspection Checklist

Location: _____ Inspector's name: _____

Date: _____ Inspector's signature: _____

Time: _____ Site 300 EA signature and date: _____

| Condition of the facility | Condition as described? | If correction needed, describe condition and needed repairs. | Corrections completed? | Date completed |
|---|---|---|---|---|
| **DESCRIPTION** | **Yes / No** | **INSPECTOR'S COMMENTS** | **Y/N** | **DATE** |
| 1. Cap is in good condition. | | | | |
| a. No settlement or gullying observed. | | | | |
| b. No surface erosion visible. | | | | |
| c. No fissures visible. | | | | |
| d. No cracks visible. | | | | |
| e. No low spots visible. | | | | |
| f. No animal burrows visible. | | | | |
| g. No bare spots observed. | | | | |
| h. No subsidence observed. | | | | |
| i. No vegetation beyond topsoil layer observed. | | | | |
| 2. Runoff is diverted away from the cap. | | | | |
| 3. Erosion controls are present and in good condition (i.e, grading, vegetation, and clear diversion channels). | | | | |
| 4. Permanent, surveyed benchmarks are present and maintained. | | | | |
| 5. Groundwater monitoring network is in good working order. | | | | |
| a. Well label is intact and legible. | | | | |
| b. Surface seal is intact. | | | | |
| c. No evidence of damage (i.e, settlement, pipe tilting, poor protective pipe condition, standing water around the pipe, etc.) is observed. | | | | |
| 6. Warning sign is in place. | | | | |
| 7. Emergency Coordinator's name and phone number posted. | | | | |
| 8. Communications are in good working order. | | | | |
| 9. Access available to emergency vehicles. | | | | |
| 10. Copy of Post-Closure Plan is on file at Site 300. | | | | |
| 11. Other observations attached. | | | | |

# Appendix A

## Groundwater Elevation and COC Concentration Plots

As required by the monitoring and reporting provisions of 22 CCR 66264.97(e), this appendix presents graphical depictions of groundwater elevations and concentration trends. Concentration-versus-time plots have been prepared for all confirmed constituent of concern (COC) detections above their respective analytical reporting limits (RLs), for the permit-specified wells. The graphs for the two established wells (W-829-15 and W-829-22) present data accumulated over the last nine years, going back to 1999, showing post-closure trends since the first year of monitoring under the *B-829 Final Closure Plan* (Mathews and Taffet, 1997). The graphs for well W-829-1938, first monitored in CY 2004, present the sixteen quarters of data available.

The sequence of graphs is by parameter (groundwater elevation, concentration, or activity) and by well. Graphs show the reported parameter on the y-axis, with time on the x-axis (time in years is divided into quarterly sample periods). The header and the vertical axis labels on each plot give the units of measurement. Statistical limits of concentration (SLs) are shown on the COC graphs as horizontal dotted lines. The numerical value of an SL is also given in the plot legend. Three different symbols are used to plot the COC data: a black diamond, an inverted white triangle, and a plus sign. Their different uses are explained below.

COC detections are plotted as black diamonds. Analytical laboratories report COC measurements above RLs as detections. (The RL for a COC is a contractual concentration value near zero.) COC concentrations below RLs are non-detections and are reported as "less than the RL." For non-radioactive COCs, non-detections are assigned RL values and appear as inverted white triangles in the data graphs.

Non-detections of radioactive COCs, however, are treated differently. The reported value for radioactive COCs is the measured sample radioactivity minus the measured background radioactivity. When the result of this calculation is less than the RL, the value is plotted as a plus sign, indicating an estimated non-detection. (Note that the calculated value may be negative, or zero, if the measured sample radioactivity is less than, or equal to, the measured background activity.) When the reported activity is greater than the RL, the value is plotted as a black diamond, indicating a radioactive COC detection.

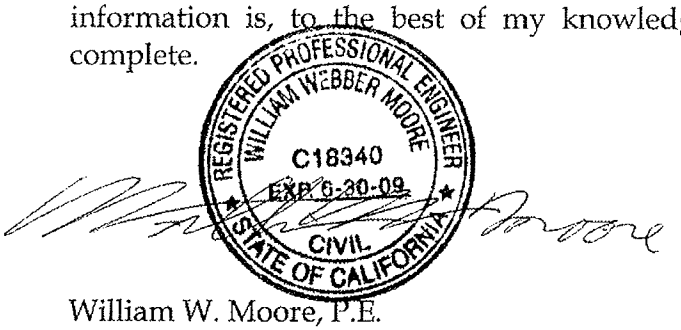
# BUILDING 829 LANDFILL CAP ANNUAL ENGINEERING INSPECTION

July 2007

## CERTIFICATION

Based on the information reviewed, I certify that this annual inspection and evaluation report fairly describes the condition of the closed Building 829 Landfill.

I certify under penalty of law that this document and all attachments were prepared in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of those persons directly responsible for gathering the information, the information is, to the best of my knowledge and belief, true, accurate, and complete.



William W. Moore, P.E.
California Civil Engineer, No. 18,340

## Table of contents

## Figures

## Executive Summary

Abri Environmental Engineering has performed the annual inspection of the Building 829 landfill cap at the Lawrence Livermore National Laboratory (LLNL) Site 300 located near the City of Tracy. Mr. William W. Moore, P.E., conducted this annual inspection on June 7, 2007. Mr. Moore is a California Registered Civil Engineer, with extensive experience in civil engineering, and hazardous waste management.

This report has been prepared consistent with the scope of work, dated April 16, 2007 and in compliance with 22CCR Section 66264.228(K). The report is based on the observations made during the inspection and review of the documents listed in section 1.0.

Building 829 Landfill cap is generally in good condition. The vegetation cover is relatively thick and covers the soil cap over the pits; there is no visible erosion of the cap; and the drainage system is in good condition and appears to be functioning as intended. The groundwater monitoring system appears to be in good condition as well. Some evidence of animal burrowing was observed. Recommendations on these observations are made in section 2-14.

## 1.0 Introduction

LLNL Site 300, EPA ID Number CA2890090002, is owned by the U.S. Department of Energy (DOE) and is operated jointly by the University of California (UC) and DOE. The Site comprises approximately 7,000 acres of largely undeveloped land and is primarily used as an explosives test facility. Site 300 is located 15 miles southeast of the LLNL Livermore Site, and 6 miles southwest of downtown City of Tracy, California, see Figure 1. About one-sixth of the Site is in Alameda County and the balance is in San Joaquin County.

Building 829 landfill area is located in the southeastern side of Site 300, See Figure 2. Building 829 area was used to burn explosives and explosive contaminated wastes at the HE Open Burn Treatment Facility. In 1997 LLNL closed the facility according to a DTSC approved RCRA closure plan. As a result the area was closed as a landfill with an engineered cap consisting of a minimum of 2 ft compacted general fill, a layer of geosynthetic material and a minimum of 2 ft vegetative soil.

The inspection of the cap included walking the surface and perimeter of the cap. Weather conditions were sunny, temperatures in 60's degree F with winds 10-15 miles per hour.

In conjunction with the inspection, the following project files and documents were reviewed:

- Closure Plan for the High-Explosives Open Burn Treatment Facility at Lawrence Livermore National Laboratory, Experimental Test Site 300, dated July 1993,
- Annual Pit Survey Data from 2001 to 2006,
- Specification PCS-1227, Site 300 Building 829 HE Burn Pits Closure, dated September 1997,
- Monthly Post-Closure Inspection Checklist, dated March 22, 2006 until February 14, 2007
- B829 Quarterly Monitoring Well Inspection Checklist, dated July 10 2006 until April 5, 2007.

## 2.0 Inspection Observations and recommendations

The inspection of the cap included walking the surface and perimeter of the cap. The following sections describe the condition and recommendations.

The landfill has a 3 ft high retaining wall at the southwest corner of the cap. The wall appears to be in good condition and appears to be performing as intended.

### *2-1. Condition of Access Control (Fences, Gates and Warning Signs)*

LLNL site 300 is a highly secured site with around the clock armed guards and perimeter fence. The entrance to the site is on Corral Hollow Road, which is secured by gates, fences and armed guards. Warning signs in English and Spanish are posted adjacent to the pits, see figure 3.

### *2-2 Condition of Vegetation*

The landfill is covered with thick and well established vegetation. There are, however, areas where the soil and vegetation is churned/loosened up (consistent with animal burrowing).

### *2-3 Erosion*

There was no erosion visible on the site. Evidence of some minor erosion off the engineered cap on the steep slope on the northeast side of the cap was observed. This minor erosion has not affected the engineered cap or any other aspects of the regulated unit, however, it should be monitored periodically for any evidence of worsening.

### *2-4 Cracking*

No cracking or other desiccation of the cover was visible during the site visit.

### *2-5 Disturbance by Adverse Weather*

No erosion or other evidence of disturbance/damage due to adverse weather (i.e. freezing and thawing) was observed at the site.

### *2-6 Seepage*

No evidence of seepage or discharge was observed beyond the existing collection structures at the facility.

### *2-7 Slope Stability*

No indication of slope instability was observed. There were no sign of slumping or shallow, localized failure.

### *2-8 Subsidence*

No evidence of subsidence was observed over the pit. A minor depression on the southeast side of the cap was observed during the inspection. It was determined that the depression was not a defect with the cap, but rather soil that covered a Christy traffic valve box used to cover a cleanout access location, see figure 4.

### *2-9 Settlement*

Results of the annual pit survey data from 2001 to 2006 showed maximum settlement of .09 feet, with an average value of .05 feet across the pit surface area.

### *2-10 Condition of Groundwater Monitoring System*

No evidence of compromise in structural integrity of the groundwater monitoring wells was observed onsite or indicated in the existing inspection logs.

### *2-11 Condition of Run-On and Run-Off Control Systems*

Surface runoff diversion structures consist of a perimeter drainage V-ditch. The V-ditch has expansion joints every 12 ft and every other one is caulked. The remaining expansion joints appear to be saw cuts partially onto the surface of the concrete. The structure also collects water from the "drainage layer" of the cap through a series of drainage pipes. Concrete lining appears to be in good condition. Concrete trench joints are sealed and in good condition.

### *2-12 Condition of Surveyed Benchmarks*

The settlement markers appeared to be in good condition.

### *2-13 Burrowing Animals*

A few small burrowing animal holes, approximately 2 inches in diameter, and a few larger burrowing animal holes, approximately 8 inches, see figure 5, were observed on the cap. It is recommended that holes exceeding 18 in. in depth and 6 in. in diameter be repaired.

### *2-14 List of recommendations for Building 829 Landfill*

- Fill in the animal holes exceeding 18 in. in depth and 6 in. in diameter on, the cap and reseed where necessary.
